## Gebietsstand

Die Angaben für Deutschland beziehen sich auf die Bundesrepublik Deutschland nach dem Gebietsstand seit dem 3.10.1990.

## **Vorbemerkung**

Die Zerlegung von Zeitreihen in einzelne Komponenten, die jede für sich betrachtet besser analysiert werden können als die Reihe der Ursprungswerte, ist ein schwieriges theoretisches Problem. Bei der Zerlegung ökonomischer Zeitreihen wird von der Vorstellung ausgegangen, daß sich die Reihen aus verschiedenen Bewegungskomponenten zusammensetzen, die auf unterschiedliche Einflußfaktoren zurückzuführen sind. Weitgehend anerkannt ist die Unterscheidung zwischen längerfristigen, saisonalen, kalendarischen und irregulären Ursachen. Dementsprechend werden die Reihen in Trend-, Saison- und Restkomponenten zerlegt, einige Verfahren trennen auch noch den Einfluß von Kalenderunregelmäßigkeiten. Die Auswirkungen der langfristigen, saisonalen und anderen Einflußfaktoren sind aber im einzelnen unbekannt, deshalb gibt es keine objektiv "richtige" Zeitreihenzerlegung. Die konkrete Komponentenzerlegung mittels eines Analyseverfahrens muß von Annahmen über Struktur und Eigenschaften der Einflußgrößen sowie deren Zusammenwirken ausgehen. Diese Annahmen können sich von Verfahren zu Verfahren erheblich unterscheiden. Darüber hinaus setzen die Verfahren der Zeitreihenzerlegung auch unterschiedliche Prioritäten im Hinblick auf allgemein gewünschte Eigenschaften, z.B. bei besonderen Anforderungen an die Stabilität der Ergebnisse usw. Aus diesen Gründen werden Zeitreihenanalyseverfahren nicht allen Ansprüchen an eine Zerlegung gleichermaßen gerecht. Letztendlich muß der Anwender entscheiden, welches Verfahren seine speziellen Anforderungen an eine Analyse am besten erfüllt.

Wie unterschiedlich einzelne Verfahren Zeitreihen zerlegen, wird besonders durch den direkten Vergleich mehrerer Verfahren deutlich. Das vorliegende Heft stellt für die Quartalswerte wichtiger Aggregate der Volkswirtschaftlichen Gesamtrechnungen Saisonkomponenten und glatte Komponenten nach dem Berliner Verfahren (BV 4) und nach der Standardversion des Census-Verfahrens (X-11, multiplikative Variante) dar, wobei allerdings die im Census-Verfahren vorgesehene Ersetzung von Extremwerten bei der Schätzung der Reihenkomponenten zur besseren Vergleichbarkeit mit BV 4 nicht angewendet wurde. Die Ergebnisse unterscheiden sich vor allem dadurch, daß BV 4 gegenüber X-11 im allgemeinen einen ruhigeren Trendverlauf, eine flexiblere Saisonfigur und häufig geringere Restwerte ermittelt. Beide Verfahren sind auch im Statistischen Informationssystem des Bundes (STATIS-BUND) verfügbar.

Die hier veröffentlichten Census-Ergebnisse unterscheiden sich von denen der Deutschen Bundesbank, da diese im allgemeinen nicht die Standardversion des Census-Verfahrens einsetzt, sondern reihenspezifische Optionen zur Steuerung des Verfahrens verwendet und darüber hinaus eine Kalenderbereinigung für die Zeitreihen der Entstehungs- und Verwendungs-

seite durchführt. Die Deutsche Bundesbank hat ihre Vorgehensweise beschrieben in Deutsche Bundesbank, Monatsbericht, Oktober 1987 und April 1991.

Die Tabellen mit den Angaben nach beiden Verfahren der Zeitreihenzerlegung in diesem Heft sind identisch aufgebaut und stellen für die Quartale ab 1991 die Originalwerte (mit prozentualen Veränderungsraten gegenüber dem entsprechenden Vorjahresquartal), die saisonbereinigten Werte (mit Veränderungsraten gegenüber dem Vorquartal) und die eigentliche Zerlegung der Reihen in Saison-, Trend- und Restkomponente dar. In Spalte 10 werden die vierteljährlichen Veränderungsraten der saisonbereinigten Werte auf Jahreszuwachsrationen hochgerechnet, um einen Vergleich mit den "annual rates", wie sie vor allem in den USA gebräuchlich sind, zu erleichtern. Spalte 11 enthält den Überhang, eine hochgerechnete Jahreszuwachsrate für das laufende Kalenderjahr unter der Annahme, daß das erreichte saisonbereinigte Vierteljahresniveau auch für den Rest des Jahres gilt (beim 4. Vierteljahr entsprechend für das folgende Jahr).

Um die Einschätzung von Kalendereinflüssen zu erleichtern, werden am Ende dieses Heftes monatliche, vierteljährige und jährliche Arbeitstage - bis 1990 für das frühere Bundesgebiet, ab 1991 für Deutschland - nachgewiesen, ferner die Arbeitstage in Prozent gleichnamiger (spezifischer) Periodendurchschnitte und in Prozent eines Durchschnittsmonats von 20,8 Arbeitstagen, eines Durchschnittsquartals von 62,4 Arbeitstagen und eines Durchschnittsjahres von 249,7 Arbeitstagen (Normperiode).

Obwohl die Zeitreihen noch sehr kurz sind, wurde für Deutschland eine Saisonbereinigung durchgeführt. Dafür muß für die ersten Quartale eine erhöhte Unsicherheit in Kauf genommen werden.

Methoden zur Zeitreihenanalyse finden Sie in STATIS-BUND unter den Namen:

- SAIX11QU: Zeitreihenanalyse nach dem Census-Verfahren X-11 für Quartalswerte.  
SAIX11MO: Zeitreihenanalyse nach dem Census-Verfahren X-11 für Monatswerte.  
SAISBV4Q: Zeitreihenanalyse nach dem Berliner Verfahren (Version 4) für Quartalswerte.  
ZRABV4: Zeitreihenanalyse nach dem Berliner Verfahren (Version 4) für Monatswerte.

## Erläuterungen zu den Tabellen

- Spalte 1 enthält die nicht-saisonbereinigten Originalwerte (Ursprungswerte) in Milliarden DM bzw. 1000 Personen.
- Spalte 2 enthält Veränderungsraten für die Originalwerte der Spalte 1. Verglichen wird jeweils mit dem Wert im entsprechenden Vierteljahr des Vorjahres (**Vorjahresvergleich**).
- Spalte 3 enthält saisonbereinigte Werte in Milliarden DM bzw. 1000 Personen. Diese Reihe besteht aus Trend und Restkomponente (Spalte 3 = Sp.1 - Sp. 5 = Sp.7 + Sp.9).
- Spalte 4 enthält Zuwachsrraten für die saisonbereinigten Werte der Spalte 3. Verglichen wird jeweils mit dem unmittelbar vorangegangenen Vierteljahr (**Vorquartalsvergleich**).
- Spalte 5 enthält die Saisonkomponente in Milliarden DM bzw. 1000 Personen. Dargestellt wird die Saisonkomponente als absoluter (DM-) Betrag, so daß eine Addition von Saison-, Trend- und Restkomponente den Originalwert ergibt.
- Spalte 6 enthält die Saisonkomponente zusätzlich in Prozent der Ursprungswerte (Spalte 1). Mit dieser Angabe sollen Änderungen der Saisonfigur im Zeitablauf besser sichtbar gemacht werden, als dies Spalte 5 vermag.
- Spalte 7 enthält den Trend in Milliarden DM bzw. 1000 Personen.
- Spalte 8 enthält im **Vorquartalsvergleich** Veränderungsraten für den Trend.
- Spalte 9 enthält die Restkomponente (irreguläre Komponente) in Milliarden DM bzw. 1000 Personen.
- Spalte 10 enthält auf Jahresrate hochgerechnete Veränderungsraten der saisonbereinigten Werte (Spalte 3). Diese Darstellung der Entwicklung mit Hilfe von "annual rates" ist vor allem in den USA üblich (berechnet als 4. Potenz des Quotienten aus den saisonbereinigten Werten des Berichts- und des Vorquartals, abzüglich 1, mal 100).
- Spalte 11 Der sogenannte Überhang ist eine Hilfsgröße, die angibt, welche Veränderungsrate sich für das Berichtsjahr bei Stagnation, auf dem zuletzt erreichten saisonbereinigten Niveau ergäbe. Der Überhang im vierten Quartal trifft dieselbe Aussage für das nachfolgende Kalenderjahr. Gerechnet wurde wie folgt:
- 1.Vj:  $[Sp.3 (1.Vj) \times 4 / Sp.3 (\text{Summe des Vorjahres}) - 1] \times 100$
- 2.Vj:  $([Sp.3 (1.Vj) + Sp.3 (2.Vj) \times 3] / Sp.3 (\text{Summe des Vorjahres}) - 1) \times 100$
- 3.Vj:  $([Sp.3 (1.Vj) + Sp.3 (2.Vj) + Sp.3 (3.Vj) \times 2] / Sp.3 (\text{Summe des Vorjahres}) - 1) \times 100$
- 4.Vj:  $[Sp.3 (4.Vj) \times 4 / Sp.3 (\text{Summe des aktuellen Standes}) - 1] \times 100$
